Connecting to Tableau Server

Use this component to connect to a Tableau server.

Connection settings

To set up the connection, specify the following settings:

- **Caption**: Enter a custom name for the connection.
- **Server address**: Enter the URI of the Tableau server.
- **Site**: Enter the name of the site where you work with the Tableau server.
- **Username**: Enter your username for the server.
- **Password**: Enter your password for the server.
- **Test**: Click to test the connection to the server.

> **Important:** This feature is only available on the Windows operating system. Before you set up the connection, place the Tableau SDK dynamic-link libraries (the `TableauExtractAPI_64` and `TableauSDK_64` folders) in the same folder as the `Megaladata.exe` file. Keep the internal folder structure (e.g., `C:\Program Files\Megaladata\Server` for a server edition, or `C:\Program Files\Megaladata\Community` for the Community edition).
