Export to Excel File

The handler exports the table data to the files for Microsoft Excel. It is possible to set the following file formats:

- Excel 2003 (.xls extension);
- Excel 2007 (.xlsx extension).

Ports

Input

- Data source: the data table to be exported.
- Control variables (optional port): it is possible to set values of the wizard parameters using variables.

Wizard

- **File storage** enables to display information on method of connection to the destination file.
- **File name/URL** enables to set a path to the destination file when the connection is local, or a file name when using connection to a folder. ... button calls the file selection dialog.
- **Sheet name**: the name of the sheet in the Excel file that contains the exported table. Default value — *Sheet 1*.
- **Headers row** enables to define headers for the table in Excel.
  - No headers row.
  - Fields names.
  - Fields captions.
- **Excel file type**
  - Excel 2003 (.xls extension).
  - Excel 2007 (.xlsx extension).
- **Activate and Show**: clicking on this button shows in the wizard how the table in Excel will look like, and to change any parameters if it is required.
