Web Services Page

For adding, editing, or deleting web services, go to the **Web Services** page. You can find it in the Navigation section in the main menu.

This page features the following commands (buttons):

- **Add**: Opens the Add web service window to configure and publish a new web service.
- **Update publication**: Re-publishes an already published web service.
- **Edit**: Opens the Edit web service window, where you can make changes to an existing service.
- **Unpublish**: Removes a web service from published.
- **Refresh list**: Updates the display to show newly published services and remove those no longer available. This ensures the list accurately reflects current publication settings.

The main area of the **Web Services** page displays the following details for each published service (package):

- Name
- Path/caption
- Last change date
- Version
- Comment

The status of each published package is shown by a color-coded indicator next to its name:

- **Green**: The web service matches the saved package.
- **Orange**: The web service doesn't match the current state of the saved package.
- **Gray**: No access to package.

Clicking on the **Expand** button to the left of a published web service's name will open the list of published nodes from the corresponding workflow. Right click on the web service opens a context menu with additional commands:

- **Open package**: opens the selected package.
- **Show package in folder**: Opens the package's location, with the package highlighted.

You can view any node within its package by right-clicking it and selecting **Open node in package**. This will open the package in a new Megaladata tab and highlight the node.
