Output Console

The **Output** console of the Preview window in the Python configuration wizard displays messages from *standard output* (`sys.stdout`) and *standard error* (`sys.stderr`). By default, the console is collapsed. To expand/collapse it, use the corresponding button (**Expand** or **Collapse**) in the window's bottom right corner.

Examples

```
import sys, warnings

#output to stdout
print(sys.path[0])
sys.stdout.write(str(99) + '\n')

#output to stderr
warnings.warn("Error!")
try:
    a = 10 / 0
except ZeroDivisionError as err:
    sys.stderr.write(str(ZeroDivisionError))
```
