Using the Clipboard in Row Filter

The **Listed** and **Not listed** conditions support clipboard commands.

In the **Value list** window, you can use the following clipboard commands from the toolbar, the context menu, or via keyboard shortcuts:

- **Copy selected** (Ctrl + C)
- **Add to selected** (Ctrl + V).

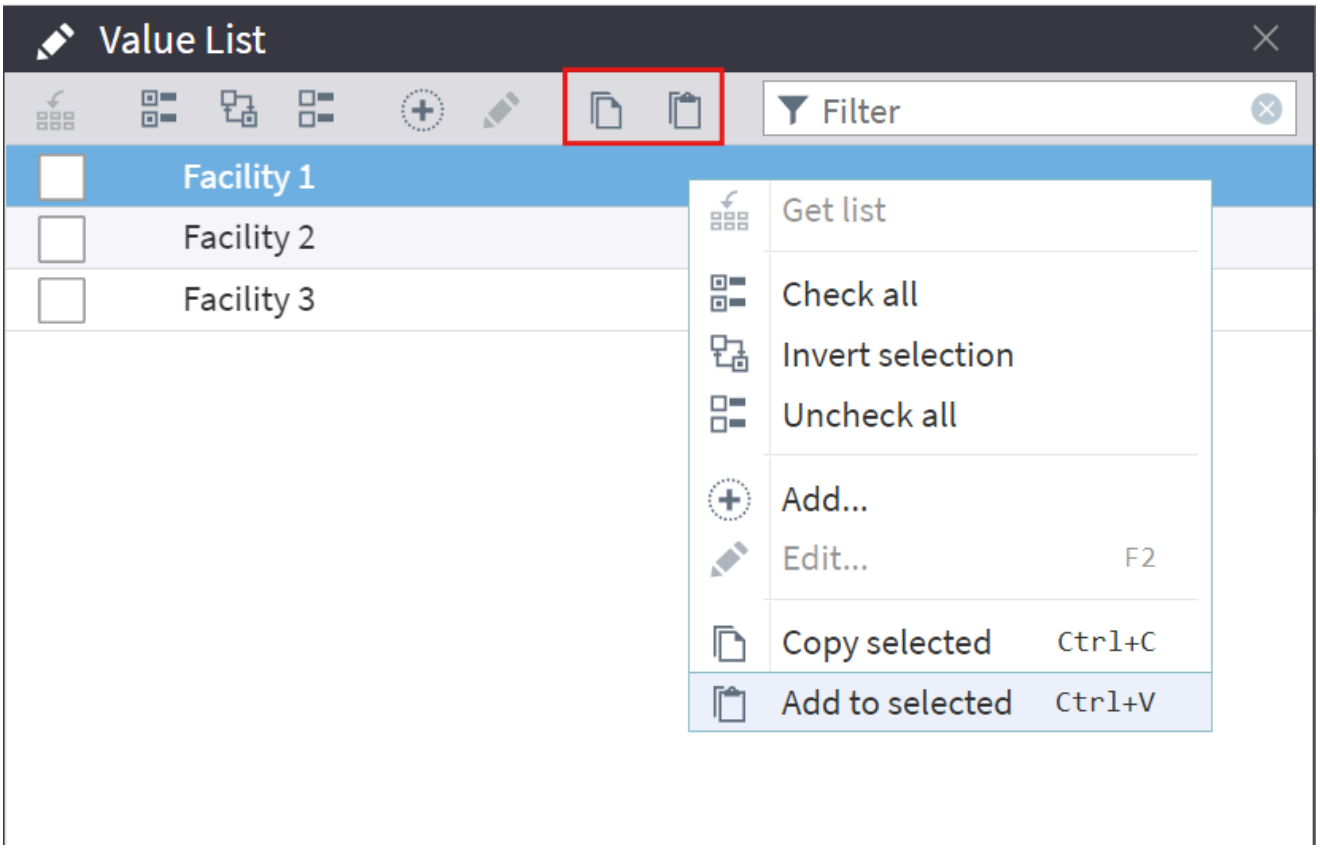

Figure 1. Value list toolbar in Row Filter

The field you select for filtering must contain discrete data.

The system uses a line break as the delimiter for copied or pasted items.

When you paste data, the system automatically validates the data type. For example, it will reject pasting a `string` into a `numeric` field. If you paste values into a list with a `variant` field, the system pastes all values as `strings` without converting them to the most appropriate data type.

For the `date/time` data type, ensure that the values match the required data format.

The system does not add duplicate values during pasting.

Additional details

The toolbar and context menu commands work both in the desktop version and in Megaladata Studio (accessed via a browser using the HTTPS protocol or on `localhost`).

> **Important:** In the Firefox browser, the **Cut** and **Copy** context menu commands work by default. To enable the **Paste** command, enter `about:config` in the browser address bar, find the `dom.events.testing.asyncClipboard` parameter, and set its value to `true`.

When working over the HTTP protocol, use the following keyboard shortcuts:

- Copy the selected value to the clipboard: `Ctrl` + `C`
- Paste values from the clipboard: `Ctrl` + `V`
